From this group, it was Francois Edouard Anatole Lucas (1870, 1876 – 1880) who gave Fibonacci numbers their name. He also investigated a similar sequence (sequence 2, 1, 3, 4, 7, 11, 18, 29, ...), which was later coined Lucas numbers. In many works these sequences are notated and () to represent the first letters of the last names Fibonacci and Lucas.

Fibonacci numbers: Introduction to the Fibonacci and Lucas ...

The Fibonacci rule of adding the latest two to get the next is kept, but here we start from 2 and 1 (in this order) instead of 0 and 1 for the (ordinary) Fibonacci numbers. The series, called the Lucas Numbers after him, is defined as follows: where we write its members as L_n , for Lucas: $L_n = L_{n-1} + L_{n-2}$ for $n > 1$.

LUCAS NUMBERS The Fibonacci recurrence, coupled with different initial conditions, can be used to construct new number sequences. For instance, let L_n be the n th term of a sequence with $L_1 = 1$, $L_2 = 3$ and $L_n = L_{n-1} + L_{n-2}$, where $n \geq 3$. The resulting sequence 1, 3, 4, 7, 11, ... is the Lucas sequence, named after Lucas.

Fibonacci and Lucas Factorizations Below are tables of known factorizations of Fibonacci numbers, F_n , and Lucas numbers, L_n , for $n \leq 10,000$. The first composite "holes" are at F_{1409} and L_{1369} . Composite factors are indicated by "(C)" following the factor. The Fibonacci series starts with $f(0)=1$ and $f(1)=1$. If we want to explore sequences where $f(0)$ and $f(1)$ are some arbitrary integers other than 1. For example, If $f(0)=1$ and $f(1) = 3$, then our sequence is a Lucas Sequence (See Figure 2a).

Golden Ratio, Fibonacci Numbers and Lucas Numbers

The Lucas numbers or Lucas series are an integer sequence named after the mathematician Fran ç ois É douard Anatole Lucas (1842 – 91), who studied both that sequence and the closely related Fibonacci numbers. Lucas numbers and Fibonacci numbers form complementary instances of Lucas sequences. The Lucas sequence has the same recursive relationship as the Fibonacci sequence, where each term is the sum of the two previous terms, but with different starting values. This produces a sequence where ...

The Lucas numbers are defined very similarly to the Fibonacci numbers, but start with 2 and 1 (in this order) rather than the Fibonacci's 0 and 1: $L_0 = 2$, $L_1 = 1$, $L_n = L_{n-1} + L_{n-2}$ for $n > 1$. This Maple program was used to produce the table below: `lucas:=proc (n) option remember; # this OPTION makes it very fast even though defined # by using an inefficient form of recursion if n=0 then 2 elif n=1 then 1 else lucas (n-1)+lucas (n-2) fi end; seq (lprint (i,`,`,lucas (i),`=`,ifactor (lucas ...`

In mathematics, the Fibonacci numbers form a sequence defined recursively by: $F_n = F_{n-1} + F_{n-2}$. That is, after two starting values, each number is the sum of the two preceding numbers. The Fibonacci sequence has been studied extensively and generalized in many ways, for example, by starting with other numbers than 0 and 1, by adding more than two numbers to generate the next number, or by ...

Generalizations of Fibonacci numbers - Wikipedia

The Lucas sequence is a related sequence with the same recurrence but different starting values of $L_0 = 2$ and $L_1 = 1$. The Fibonacci and Lucas sequences are special cases of the generalized Lucas sequences studied by Lucas in [1]. We will study these sequences in section two and the Gaussian Fibonacci sequences of Jordan [2] will be studied in section three.

Fibonacci and Lucas numbers cover a wide range of interest in modern mathematics as they appear in the comprehensive works of Koshy and Vajda. The Fibonacci numbers are the terms of the sequence wherein each term is the sum of the two previous terms beginning with the initial values $F_0 = 0$ and $F_1 = 1$.

Any sequence of the Fibonacci-type, i.e., $f_n = f_{n-1} + f_{n-2}$, can be expressed as a sum of a Fibonacci-term and a Lucas-term, as follows $f_n = (f_1 - f_0 \alpha) \alpha^n - (f_1 - f_0 \beta) \beta^n + f_0 2 \binom{n-1}{2} \alpha \beta$ where $\alpha = \frac{1 + \sqrt{5}}{2}$. In some circumstances, we find algebraic structures on some sets defined with these numbers, we generalize Fibonacci and Lucas numbers by using an arbitrary binary relation over the real fields instead of addition of the real numbers and we give properties of the new obtained sequences.
