PRINCIPLES OF COMMUNICATION SYSTEMS

If we take the process forward by another step and discard one of the two redundant and duplicate information-carrying sidebands, we would improve the communication system efficiency by another 2x factor. This would give rise to Single Sideband Suppressed Carrier (SSBSC) transmission mode. This is popularly called SSB mode. The SSB mode provides maximum efficiency of information communication because it no more contains any non-productive or redundant component of modulated RF energy.

For a perfect modulation, the value of modulation index should be 1, which means the modulation depth should be 100%. For instance, if this value is less than 1, i.e., the modulation index is 0.5, then the modulated output would look like the following figure. It is called as Under-modulation. Such a wave is called as an under-modulated wave.
